

Train to Edinburgh - Kids

UK Family Tour

The Invisible Line You'll Cross Today

Here is something strange that is going to happen to you today, and you will not feel a thing. Sometime this afternoon, your train is going to leave one country and roll straight into another one. No boat. No bridge over the sea. No airport, no passport, nobody checking anything at all. One minute you will be in England, and a moment later you will be in Scotland, and the only way you would ever know is if somebody told you.

So how does that work? Look at it this way. You are riding up one big island. It has a name, Great Britain, and the funny thing about this island is that it holds more than one country. Down at the bottom and in the middle is England, where you started this morning. Way up at the top is Scotland, where you are heading. And off to the west, where you cannot see it from the train, there is a third one called Wales. Three countries, all sharing one island, like three families living in one very long house.

And they really are different countries, not just different parts of the same place. Long, long ago, England and Scotland each had their own king and their own army, and they fought each other for hundreds of years. Today they share a king and they are the best of friends, but Scotland still does loads of things its own way. Different money. Different laws. Different schools. It even has a different pretend animal as its national symbol, a unicorn, of all things. So keep your eyes on the window. Somewhere out there is an invisible line, and the moment your train crosses it, everything on the other side is Scotland. Your whole week is about to happen up there.

Two Countries That Share a King

Let's talk about the weirdest part. If England and Scotland are two different countries, why are they both on the same island with the same king? How did that ever happen?

Here is the story, and it is a good one. Hundreds of years ago, England and Scotland each had their own king, and the two of them did not get along at all. Then, in a year we say as sixteen oh three, the Queen of England died without any children to take the crown after her. The person next in line to be king turned out to be, of all people, the King of Scotland. So this one man, named James, packed up, rode all the way south to London, and became the king of both countries at the very same time. One king wearing two crowns. Imagine being the captain of two rival football teams at once.

But even then, the two countries still had their own separate governments, arguing away in their own separate buildings, for another hundred years. Then, in seventeen oh seven, they finally joined those governments together into one. That is the moment they truly became one big country called Great Britain.

Now here is the clever bit, and it is the reason Scotland still feels so different today. When Scotland agreed to join up, the Scots said, fine, but we are keeping the things that make us us. And they did. They kept their own laws, so some rules are actually different in Scotland than in England. They kept their own schools. They kept their own churches. And they even kept their own money, which is why in a

day or two you might get a coin or a banknote that looks nothing like the ones from London, but works exactly the same. Scotland joined the club, but it absolutely refused to stop being Scotland. Pretty cool, when you think about it, for a whole country to be that stubborn about being itself.

The Train That Squished a Whole Country

Try to imagine doing this exact trip a very long time ago, before there were any trains at all. To get from London all the way up to Scotland, you would have to climb into a wooden coach pulled by horses, and then bounce and rattle along bumpy roads for almost two whole days and nights, stopping again and again to swap the tired horses for fresh ones. Two days! You are going to do the very same trip today in about four and a half hours, sitting in a comfy seat, probably munching a snack.

That is the amazing thing trains did. They did not actually move the cities any closer together. But they made them feel closer, because suddenly you could zoom between them in a day instead of a week. Before trains, the top and the bottom of this island were almost like separate worlds, and most people never travelled far enough to see the other end of their own country. Trains squished the whole place together and let everybody finally go and visit everywhere.

Here is a bonus bit of magic. Before trains, every town set its own clock by looking up at the sun, so the time in one town could be a few minutes different from the time in the next town along, and nobody cared, because nobody moved fast enough to notice. But a train has to arrive on time, so the railways made everybody use the exact same clock. Trains did not just carry people around. They made the whole country agree on what time it was.

So here is your job for the rest of the ride. Watch out the window and try to catch the land changing. Down south it is soft and green, full of hedges and gentle little fields. But the further north you go, the more it turns wild and rugged and rocky, with big open hills and bare grey stone instead of tidy farms. If you look closely enough, your own eyes will spot the country changing long before anybody tells you that you have crossed into Scotland.

Racing North on the Flying Scotsman's Line

You're riding one of the most famous railway lines in the world: the East Coast Main Line, from London King's Cross to Edinburgh — the route of the legendary Flying Scotsman. Trains have run this exact route since the 1850s, and in the old days, rival railway companies literally raced each other to Scotland, shaving minutes off, night after night, in what newspapers called the Races to the North. In 1934, the locomotive called Flying Scotsman became the first steam engine ever officially recorded at one hundred miles per hour. Four years later, on a stretch of this very line, a blue streamlined engine called Mallard hit one hundred twenty-six miles per hour — still the world speed record for steam, nearly ninety years later. Your train is faster and considerably less smoky. Things to watch for out the window: about halfway, look for Durham Cathedral and castle rising on a cliff above a river bend — one of the best views from any train in Britain, on the right side going north. Then comes the seaside: the line runs along the North Sea cliffs, and if you watch carefully near Alnmouth and Berwick you might spot castles on the coast. Keep a tally: sheep, castles, and the sea. First one to a hundred sheep wins.

Related listening: The line races right past York; you'll walk its walls in a few days. Coming up — "York: Walk on Top of a City's Armor" (York & the Minster, Day 13).

The Bullet Train and a Queen Under the Floor

Right now you're sitting on one of the fastest trains in Britain, and here's a secret about it. This train was probably built here in the North of England, in a factory in County Durham that you'll roll right past later today. The design came from Japan, and the name of the fastest of these trains is Azuma, which is a Japanese word that means "east," because you're riding the East Coast line. So you're on a Japanese-named, English-built machine that can cruise at around one hundred twenty-five miles an hour, almost as fast as that record-breaking steam engine from ninety years ago, except yours is smooth and quiet and doesn't need a single lump of coal.

Think back to the platform you left from. King's Cross station has a very famous secret wall, halfway between platforms nine and ten, where a luggage trolley sticks out of the bricks and a sign reads Platform Nine and Three-Quarters. That's the magic platform from Harry Potter, where the train to Hogwarts leaves. Loads of people line up to have their photo taken pretending to push the trolley through the wall. Your train left from a perfectly normal platform nearby, no wizards required.

Now here's the wow for this chapter. A while into the journey you pass the city of Peterborough and its enormous cathedral. Under the stone floor of that cathedral lies a real queen of England, Catherine of Aragon, the first wife of King Henry the Eighth, the king with six wives. And for a few years, another queen was buried there too, Mary Queen of Scots, before her son the king had her moved to London. So without even slowing down, your speeding train just zoomed past the grave of a queen.

One more thing to watch for early in the trip. Soon after King's Cross, the train dived into a dark tunnel, then popped back out into the daylight. If you were watching the left side, you might have spotted a huge palace on a hilltop with a giant glass front. That's Alexandra Palace, nicknamed Ally Pally, where the very first proper television pictures in the world were beamed out, back in 1936. Imagine that, the first ever telly show in history, sent out from a palace on a hill.

Here's a number to chew on while the fields whizz past. Your train is covering more than fifty meters every single second, about half the length of a football pitch. Blink, and a whole field has vanished behind you. Keep your eyes on the window. The best sights are still coming.

The Duck That Broke the World Record

Let's talk about that record-breaking engine again, because the story gets better. The fastest steam locomotive in the history of the world was named after a duck. It's true. The engine was called Mallard, which is a kind of wild duck, the one with the shiny green head that you see on ponds. And Mallard wasn't the only bird in the family. The engineer who built these engines, Sir Nigel Gresley, gave a whole flock of them bird names. There was Bittern, and Kingfisher, and Wild Swan, and Seagull, and Golden Plover. A whole stable full of birds, all built for speed.

Why a duck for the fastest one? Because these engines were shaped to slip through the air like a bird in flight. Most steam engines back then were big and boxy and flat at the front, which is terrible for going fast, because the air pushes straight back against a flat wall. But Gresley shaped the front of Mallard into a smooth, rounded, sloping nose, like the front of a modern bullet train, so the air slid up and over it instead of shoving against it. They even tested the shape by blowing wind at little models, the way you'd test a paper airplane. And they painted Mallard a beautiful deep blue, so it looked as fast as it truly was.

On the third of July, in 1938, on a long gentle downhill slope not far south of where you started today, Mallard went thundering down the hill and hit one hundred twenty-six miles per hour. That beat the old record, which had belonged to a German engine, by about a mile and a half an hour. Here's the amazing part. That was almost ninety years ago, and no steam engine anywhere on Earth has ever gone faster since. Not one. The record has stood longer than your grandparents have been alive.

Think about how fast that really is. Going down the hill, Mallard's tall wheels were spinning round about five hundred times every minute, the fire was roaring, and the whole heavy iron machine was shaking and screaming. The men on board could actually smell hot metal, because a part deep inside the engine was beginning to melt from the sheer effort. They had pushed it right to the very edge, snatched the record, and eased off just in time before anything broke.

Mallard is still around today. It doesn't run anymore, but it sits, polished and blue and beautiful, in the National Railway Museum in the city of York, which your train passes through. If you ever go inside, you can stand right next to the actual duck that beat the whole world. Give a little quack as you pass York. Mallard has earned it.

The Bridges of the Tyne and the Giant Angel

Coming up is one of the best window moments of the whole trip, so get ready. When your train reaches the city of Newcastle, it crosses a wide river called the Tyne, high up on a bridge, and for about ten seconds you get a view of a whole family of bridges all crowded together over the water, one after another after another. See how many you can count.

There's a fat green one shaped like a giant arch, called the Tyne Bridge. There's a clever one that actually tilts and lifts up to let boats through, and when it opens it looks exactly like a giant winking eye, which is why everyone calls it the Blinking Eye. And there's an old double-decker bridge with trains running on the top and cars driving underneath, built more than a hundred and seventy years ago by the son of the man they call the father of the railways. All of them, packed into one short stretch of river. It's like the bridges are showing off.

Then, a few minutes later, look to the side for something even bigger, standing up on a hill. A giant. It's a statue called the Angel of the North, and it is enormous. It stands as tall as five double-decker buses stacked on top of each other, and its two outstretched wings are as wide as the wings of a passenger jet, tip to tip. It's made of rust-colored steel, the same tough steel they use to build ships, and it was made rusty on purpose, so it turns a lovely warm orange-brown and never needs painting. It has stood on that hill since 1998, welcoming everyone who travels north, with its wings held out just a little bit forward, almost as if it's about to give the whole of Northern England a hug.

More than thirty million people see the Angel every year, most of them from cars and trains just like yours. Here's a fact to boast about later: the whole thing weighs about two hundred tonnes, heavier than a hundred cars put together, and it was built strong enough to stand up in winds fierce enough to knock you flat on your back. Now you're one of them. Wave hello. And keep counting those sheep and castles, because you're getting close to Scotland now, and the seaside part of the ride, with the real castles by the water, is about to begin.

The Warrior Queen Under the Platform

Here's a spooky secret about the station you just left. Some people say that a real warrior queen is buried underneath it. Her name was Boudicca, and about two thousand years ago she was one of the fiercest fighters in all of Britain. When the Romans invaded her land and treated her people cruelly, she raised a huge army, climbed onto her war chariot, and led them into battle. She and her warriors burned the Roman town of London right down to the ground. In the end the Romans beat her, but nobody has ever been quite sure what happened to her body.

And here's the legend. The story goes that Boudicca lies buried deep under King's Cross station, right below the platforms, maybe even under platform nine or ten. Now, is it true? Almost certainly not. Grown-up historians will tell you there's no real proof at all, and it's probably just a spooky old story. But think about where that spooky story lands. It means the fierce queen who battled the Romans is supposed to be sleeping just a few steps away from the famous magic wall, platform nine and three-quarters, where the trolley disappears into the bricks on the way to Hogwarts. A warrior queen and a wizard's train, tucked into the same corner of the same station. Not bad for a place most people just rush through.

The station itself is very old and very clever. It opened more than a hundred and seventy years ago, and when it was brand new it was the biggest railway station in the whole country. Look at a picture of the front sometime and you'll see two enormous curved arches of yellow brick, plain and strong, like two giant tunnels standing up on end.

And one more thing to spot, right at the very start of the journey. In the first few minutes after leaving, if you were looking out of the left-hand window, you might have seen a gigantic modern football stadium sliding by. That's the Emirates Stadium, the home of Arsenal Football Club, where sixty thousand fans roar every time somebody scores. So in just the first stretch of your trip, you passed a buried warrior queen, a magic wizard wall, and a giant football ground. And the train has barely got going.

A Peek at York, Where You'll Be Soon

In the middle of your journey, the train slows down and rolls through a city called York, and I want you to look out for it, because here's the exciting part. In just a few days, you're coming back to spend a whole day here. So think of this as a sneak peek, like watching the trailer before the film.

As the train goes through, press your face to the window and hunt for a truly gigantic church. It's called York Minster, and it is enormous, one of the biggest old churches in the whole of Northern Europe. Look for its tall pale towers poking up above all the rooftops. It took people about two hundred and fifty years to finish building it, stone by stone by stone. That's not two hundred and fifty years ago. That's two hundred and fifty years of actual building, so long that the workers who started it were great-great-great-grandparents by the time it was done, and none of the people who began it ever saw it finished.

York is one of the oldest cities in Britain, and it has had the most amazing lives. The Romans built it as their great fortress city in the north, and a Roman emperor actually died right here. Then, hundreds of years later, the Vikings sailed up the river and captured the whole city and made it their own, and they called it Jorvik. Remember those Viking raiders who attacked Holy Island? These were the same fearsome

people, and when you come back to York you'll get to explore a whole underground Viking street, with the sights and even the smells of how they really lived. Yes, the smells. You'll find out.

But that's for later. For now, the train only gives you a quick taste of York before it speeds up again and carries on north. So take your peek, wave hello to that giant church, and remember, York is saving all its best secrets for the day you come back.

The Fastest, Flattest Bit and a Falling Apple

Have you noticed how smooth and fast the train feels in this early part of the journey? There's a reason for that. Right now you're crossing some of the flattest land in all of Britain, a huge, wide, pancake-flat area called the Fens. There are almost no hills to climb and almost no bends to slow down for, just mile after mile of dead-straight track running across enormous flat fields. And that is exactly why this is the fastest part of the whole trip. A train can really let rip on ground like this, and this is the very stretch where those record-breaking steam engines used to build up their tremendous speed. So sit back and feel it. You are on the fastest, flattest, straightest railway in the country, doing what it was built to do.

Now here's a wonderful thing to look out for as you zoom across it. Somewhere out here you flash past a town called Grantham, and just near it is an old farmhouse with an apple orchard. And that orchard might be the most important orchard in the history of the world. Why? Because a boy named Isaac Newton grew up right there, and he went to school in Grantham, the very town you're speeding through.

The story goes that one day, young Isaac was sitting under an apple tree in that garden, thinking, when an apple dropped off a branch and fell to the ground. Bonk. Now, everybody had seen apples fall before. Millions of apples had fallen for millions of years and nobody thought anything of it. But Isaac Newton asked a question nobody had properly asked. Why does the apple fall down? Why doesn't it float up, or drift sideways? What is pulling it down toward the ground?

And thinking about that one falling apple, he worked out one of the biggest secrets in the entire universe. He figured out gravity, the invisible pulling force that holds you on the ground, that keeps your feet from floating off, that makes a dropped toy fall and a thrown ball come back down. The very same force that keeps the Moon circling the Earth and the Earth circling the Sun. All of it, from one apple, near a town you're rushing past right now. So next time an apple, or anything at all, falls off your table, you can say, aha, gravity, just like Isaac Newton. And you'll know it was more or less invented right here, out of the window, in the flattest, fastest part of your ride to Scotland.

Crossing into Scotland

Just after the town of Berwick-upon-Tweed, your train rumbles over the Royal Border Bridge — twenty-eight huge stone arches, forty meters above the River Tweed, opened by Queen Victoria in 1850. A few minutes later, you cross an invisible line: the border between England and Scotland. No fence, no passport check — but you're now in a different country within the United Kingdom, and you'll notice it fast. Scotland has its own flag, the white X on blue, called the Saltire. Its own banknotes — Scottish pounds, which are real money but look completely different. Its own national animal, which is, genuinely, the unicorn. And its own accent, which you'll be happily confused by within the hour. Poor Berwick, the town you just passed, changed hands between England and Scotland more than a dozen times over the centuries as the two countries fought over it — it's England's most bitten-over town, and its football team, funnily enough, plays in the Scottish leagues to this day. As you get close to Edinburgh, watch the right side for the sea and the left for hills. When you step out at Waverley station, look up: you'll be in a valley with a castle on a cliff right above you. That's tomorrow's adventure staring down at you.

Related listening: Holy Island, seen from the train, is where the Viking Age began in 793.
Coming up — “The Battle That Ended the Vikings” (JORVIK & Viking York, Day 14).

Holy Island and the Vikings

As your train runs along the seaside in the far north of England, watch the window for the North Sea, and keep an eye out for a low island just off the coast with a little castle on it. That's Holy Island, also called Lindisfarne, and it has one of the strangest features of any place in Britain. Twice a day, it isn't an island at all.

Here's how it works. A narrow road runs across the sand from the mainland out to the island. But when the tide comes in, the sea rises and floods right over that road, and the whole thing vanishes under the water. For hours, nobody can drive on or off. Then the tide goes out again, the road reappears dripping with seaweed, and the island joins back onto the land. People who forget to check the tide times sometimes have to scramble up onto a little wooden rescue tower and wait there, with their car sitting underwater below them, feeling very silly indeed.

More than a thousand years ago, this tiny island was one of the most important and most peaceful places in the whole country. Monks lived there in a monastery, quietly making the most beautiful books you have ever seen, hand-painted with gold and swirling patterns and tiny creatures hidden inside the letters, one page at a time. One of those books, called the Lindisfarne Gospels, has actually survived to this day, more than thirteen hundred years old, and it is now so precious that it lives inside a special case in a great library down in London. And then, in the year 793, something terrifying happened. Longships appeared on the water, filled with warriors from across the sea. The Vikings had arrived. They stormed the island, smashed the church, stole the treasure and the golden books, and sailed away. People all across the country were horrified. Nobody had ever dared attack a holy place like that before. Many historians say that awful day was the true beginning of the age of the Vikings in Britain.

So as you glide past Holy Island in your warm, comfy train, picture those longships out on the cold grey water, and the frightened monks, and be very glad you're arriving in a rather friendlier century than they did.

Castles by the Sea

This stretch of coast, in a part of England called Northumberland, has more castles than almost anywhere else in the whole country, and from the train you have a real chance of spotting them. So this chapter is a challenge. Become a castle-hunter.

The biggest one to watch for sits on a giant rock right above the beach, above a huge stretch of pale golden sand. It's called Bamburgh Castle, and it is exactly what a castle is supposed to look like, long walls and tall towers standing guard over the sea. Real kings ruled the whole north of England from that rock more than a thousand years ago. Waves crash on the shore below it, and on a windy day the sea spray flies right up the cliff. And just out to sea from here, on a wild stormy night long ago, a brave young woman named Grace Darling rowed a tiny rowing boat out through the crashing waves to rescue drowning sailors from a wrecked ship. She became the most famous girl in the whole country, and people still tell her story nearly two hundred years later.

A little further along, tucked inland, is another famous one you might not see from the train but really should know about. Alnwick Castle. If it looks familiar in photos, that's because it played the part of Hogwarts School in the very first Harry Potter films. The young wizards learned to fly their broomsticks in its courtyard. And here's the best bit. Real children can take actual broomstick-flying lessons there today, which sounds like the greatest school trip ever invented.

And there's a spooky one too, called Dunstanburgh, except this one is a ruin. Just jagged, broken towers standing all alone on an empty headland, with no road to reach them. You have to walk a long way across the fields to get there, past the sheep, and when you finally see it looming up, grey and crumbling against the sky, it looks like exactly the sort of place where a dragon might live.

So here's your mission for the next half hour. Press your nose to the glass and look for anything with stone walls and towers, up on the hills or down by the shore. Every castle counts. Shout it out the moment you spot one. Whoever has counted the most castles by the time you cross the border into Scotland is the official Castle Champion of the entire family. Ready? Eyes on the window. Go.

A Volcano and a Station in a Vanished Lake

The last part of your journey is the prettiest of all. After you cross into Scotland, the train hugs the coast again and runs past a little seaside town called Dunbar. Here's a story an American should love. A boy was born in that town, long ago, named John Muir. He grew up climbing the cliffs and poking about in the rock-pools right there. Then he sailed away to America, fell head over heels in love with its wild mountains, and spent the rest of his life persuading people to protect them. Because of John Muir, from tiny Dunbar, America created some of its greatest national parks, including Yosemite, with its towering cliffs and thundering waterfalls. A Scottish boy helped save the wild places of America.

Now watch ahead, because Edinburgh is about to appear, and it appears in the most dramatic way possible. Rising up out of the city is a great green hill with a rocky top. That hill is called Arthur's Seat, and it is an extinct volcano. Don't worry, it hasn't erupted in more than three hundred million years, so you're perfectly safe, but the whole city was built around the bones of an ancient volcano. And on another great chunk of old volcanic rock, a steep black cliff, stands Edinburgh Castle, keeping watch over everything. See if you can spot it up there. You'll get to climb right up to it tomorrow. And here's a lovely bit of Edinburgh weirdness to listen out for: nearly every day, at exactly one o'clock, the castle fires a real cannon, with a great booming bang that rolls out across the whole city, so that everybody can check their watches by it.

Then your train slides into the station, which is called Waverley, and here comes the last surprise. The station sits down in a deep valley in the very middle of the city. But hundreds of years ago, that valley

wasn't a valley at all, it was a lake. A smelly, mucky, murky lake called the Nor Loch. The townspeople drained all the water away, and where the lake used to be, they built the railway station and some gardens. So when you step off the train, remember this. You're standing at the bottom of a lake that isn't there anymore, underneath a castle that sits on a volcano. Welcome to Edinburgh. It's going to be brilliant.

The Silver Water and the Mountain You'll Climb

You're nearly there now, and the last little bit of the journey is full of things you're going to see up close very soon. So this is like a treasure map. Keep your eyes peeled.

First, watch out of the right-hand window for the sea to change its shape. Out there, the wide open ocean slowly turns into a huge shining arm of water that reaches in toward the land, like a giant silver river. That's called the Firth of Forth, and here's why it's exciting for you. In just two days, you're going to be out on that very water in a boat. You'll sail across it to a tiny island with a crumbling old stone abbey on it, called Inchcolm, where monks lived hundreds of years ago. And somewhere out on that water there's one of the most famous bridges in the whole world, a gigantic bridge made of red steel, built more than a hundred years ago, shaped like three enormous diamonds standing in a row. So the water you're gliding past right now is the water you'll be bobbing about on very soon. Give it a wave.

Now look ahead and a little to the left, because a mountain is about to rise up right in the middle of the city. A real one, green and steep with a bare rocky top. It's called Arthur's Seat, and it's an old, sleeping volcano. Don't worry, it hasn't erupted in more than three hundred million years, so it's perfectly safe. But here's the brilliant bit. In a few days, you are going to climb it. All the way up to the very top, with your own two feet, and from up there you'll be able to see the whole city, the sea, the bridges, everything, spread out below you like a map. So as it slides past the window, take a good long look and size it up. That's your mountain. You're going to conquer it.

Out on that abbey island, by the way, watch for something else when you visit. Puffins and seals and thousands of noisy seabirds live all around the Firth, wheeling over the water and squabbling on the rocks, and grey seals sometimes pop their heads up to stare at the passing boats like curious dogs. So the silver water you're gazing at now is going to be full of surprises when you finally get out on it.

And beyond the mountain, getting closer and closer, you'll spot another great lump of old volcano with a castle perched right on top. That's Edinburgh Castle, and it means you have very nearly arrived. Bags ready. Scotland is here.

Your Train Is in a Secret Race

Here's something you probably didn't know about the exact train you're sitting on. It's in a race. Not a race you can see out of the window, but a real one, going on all the time, and your train is one of the racers.

Your train is called a Lumo. And on this same railway line there are other trains, run by a different company, painted a different colour, and the two of them are competing to see who can carry people up to Scotland the best. But here's the really surprising part. The train your family is actually trying to beat isn't the other train at all. It's the aeroplanes. High up in the sky above you, planes are flying people from London to Edinburgh too. And your Lumo train is trying to prove that going by train is better than flying. No airport, no waiting around in long queues taking your shoes off, and you get to sit and watch castles and the sea roll by, instead of just looking at clouds. Plus, if you book your tickets early, the train can be much, much cheaper than a plane. That's the whole clever idea behind Lumo. Be cheap, be comfy, and beat the planes.

Now feel how quiet and smooth your train is. That's a special trick too. This train doesn't burn any fuel at all, not a single drop. It doesn't puff out any smoke like the old steam engines did. Instead, it's completely electric, and it gets all its power from a wire strung up high above the track, the way a toy racing car gets power from the track underneath it. Look up next time you're near a window and you might spot the wires. That's what's pushing you along at about a hundred and twenty-five miles an hour, silently.

And because it doesn't burn any smoky fuel, your train is also much kinder to the planet than flying. When a plane flies to Scotland, it puffs out huge clouds of dirty gas high into the sky. Your electric train doesn't do that at all. So every time a family chooses the train instead of the plane, the air stays a little bit cleaner. You're not just racing the planes, you're beating them at being tidy, too. That's a race worth winning.

And here's a fact to make you smile. This very train was partly built in England, in a big factory up in the north that you'll actually go past later today, but the design came all the way from Japan. So you're riding a super-quiet, super-fast, half-Japanese electric racer, zooming up the same tracks where steam engines raced each other more than a hundred years ago. The race to Scotland has been going on for a very, very long time. And right now, you're winning it.

The Most Famous Engine in the World

You've heard about Mallard, the duck-shaped engine that broke the speed record. Now meet the other superstar of this railway line, and this one might be even more famous. It's a big green steam engine called the Flying Scotsman, and it is probably the most famous locomotive on the entire planet.

First, a little puzzle. Flying Scotsman was the name of a train service, the ten o'clock express that ran from London up to Scotland every single morning. But it was also the name given to one particular engine, painted a beautiful deep green with the number four-four-seven-two on its side. And that engine became a legend.

Here's the first amazing thing it did. Back in nineteen twenty-eight, it pulled a train all the way from London to Edinburgh without stopping even once. Now that might not sound hard, but think about it. A steam engine needs two people driving it, a driver and a fireman, and shovelling coal into a roaring fire for eight hours without a break would completely exhaust anybody. So how did they swap the tired crew for a fresh one without stopping? They came up with a genius trick. They built a secret tunnel, a narrow little corridor, running right through the middle of the coal-and-water wagon behind the engine. So a fresh driver and fireman could squeeze through that tiny passage from the train, all the way to the engine, and take over while it was still thundering along at full speed. The tired ones squeezed back the other way for a rest. A crew swap at sixty miles an hour, through a tunnel in a pile of coal. Brilliant.

Then Flying Scotsman became the first engine ever officially timed going a hundred miles an hour, back in nineteen thirty-four. But its adventures were only getting started. When it grew old and the railway didn't need it anymore, people loved it far too much to scrap it. So it went travelling. It was shipped across the ocean to America, where huge crowds came to see it puff along past skyscrapers. Then it sailed all the way to Australia, on the other side of the world, and while it was there it ran the longest-ever non-stop trip by any steam engine, more than four hundred miles across the outback. By the time it came home, the Flying Scotsman had actually travelled right the way around the whole world. A steam engine that went round the globe.

Today it still runs, all cleaned up and gleaming green, taking lucky passengers on special trips, and enormous crowds still gather on bridges just to watch it go by. So on this journey you're following in the wheel-tracks of a genuine legend. Somewhere on this very line, that famous green engine roared north, with a fresh crew crawling through a tunnel of coal. Listen closely, and you can almost hear it.
